FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

VOL. L. JUNE 1945. No. 6.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

June made her debut with the arrival of snow traces at Coudersport, Eagles Mere, Gouldsboro, Hollisterville, and Scranton, the third occasion of record in 58 years. Previously it had been noted at Cassandra, Hanover, and Wilkes-Barre June 1, 1907, and at Mt. Pocono on June 23, 1918.

The attending cold which remained ten days (averaging 9° below normal, and accumulating the entire month's deficiency) necessitated fires being rekindled with diminishing fuel supplies. A number of long standing records for the lowest June temperatures were equalled or lowered on the first in the southeast and widespread on the 6th over western and northern plateau counties. Damaging frosts on the latter date recalled to the minds of many residents the stories of the "Year of the Frost" (1859) when everything was wiped out west of the mountains by a late frost.

By the 10th, the temperature reached the normal level for June and continued above to the end, with but brief interruptions. During the 12-day period (10-21st) there were thunderstorms reported some place in the state every day. Storm damage was reported on the 13th from Mechanicsburg and Philadelphia. The next day was the warmest of the year to date, and deaths from prostration and drownings began to mount. Heavy afternoon thunderstorms produced damage from Martinsburg to Carlisle on the 15th. Two days later a loaded Pittsburgh trolley was struck by lightning and 21 persons were injured. The first day of summer (21st) was attended by the passage of a cold front which set off a series of vigorous thunderstorms, spreading minor damage across the state.

A high cloud cover noted over the eastern portion of the state on the 26th was the evidence of the season's first tropical disturbance. It passed up the coast, well to the east, in the next 24 hours.

The most violent storms of the month occurred on the 28th, causing one death near Williamsport, and half to a million dollars in damage from Lycoming to Philadelphia Counties. Much hail was reported in these storms; at Liverpool hailstones the size of walnuts covered the ground, broke windows, flattened crops, stripped trees, and damaged tin and shingle roofs not previously harmed by wind or lightning. Elsewhere mostly wind, rain, and lightning caused damage, but hail was of less severity.

June's departure was not without strong contrast to its debut. The early morning (low) temperatures of the 30th were probably the highest of record.

The accumulated precipitation departure since the first of the year is +1.58 inches, and excesses for the first three months of the growing season are general, with the exception of deficiencies beginning in a number of western counties. Field crops have improved during the month, although cold at the beginning, too wet in the east, and quite dry in the west. Fruit prospects have declined; frosts, thunderstorms, and hail, in various localities, all combined to produce a heavy drop of fruits.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 83 stations was 66.7°, which is 1.5° below the 58-year normal for June. The highest monthly mean was 75.4° at Marcus Hook, and the lowest was 60.2° at Kane. Extremes ranged from a maximum of 103° at Marcus Hook on the 30th, to a minimum of 27° at Kane on the 6th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 198 stations, was 4.07 inches, which is 0.06 inch below the 58-year normal for June. The greatest monthly amount was 7.10 inches at Bradford, while the least was 1.56 inches at Gettysburg. The greatest amount recorded in any 24 consecutive hours was 2.66 inches at Millersburg on the 28-29th.

ERRATA

January, 1940.—Page 2, Claysville, precipitation departure should be 2.22 inches.
Annual, 1940.—Page 74, Claysville, total precipitation should be 43.78 inches. Page 76, Claysville, departure in January should be —2.22 inches, total precipitation should be 43.78 inches, departure should be +3.48 inches.

VOL. L. JULY 1945. No. 7.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Frequent thunderstorms, approaching cloudburst proportions, dominated July's weather. Loss of life, injuries, extensive crop and property damage resulted. At Wild Creek Reservoir in Carbon County, source of Bethlehem's municipal water supply, 17.89 inches of rain during the month broke the previous all-time record of 17.70 inches, which occurred at York in August 1933. However, this new value is still far outdistanced by the 35-inch United States record for an indicated rainfall of less than 24 hours duration, made during the McKean and Potter Counties storm of July 17-18, 1942. Although twenty-one stations reported new July, and nine others new all-time records, the State average of 5.75 inches is not near a record.

July 1 was the warmest day of the month, and the death toll from various causes due to the heat reached its peak, the heat having made a good start during the close of June. Cooler weather set in the next day. As a result, damage and injuries were reported in the Philadelphia area due to thunderstorms generated during the change of airmass. However, even more severe storms were prevalent on the 5th in that area as the weather warmed up. One person was killed by lightning, two trolley cars were struck; sewers backed up, stalling autoists and interrupting subway and surface transportation.

On the early evening of the 9th, portions of Northampton and Lehigh Counties experienced one of the worst electrical and torrential rainstorms of record. In a few brief hours, between 7 and 11 p. m. E. W. T., six died (four in Phillipsburg, N. J.). Crops and property suffered damage amounting to about four million dollars, due to inundation, erosion, wind, hailstones as large as hickory nuts, and fires started by lightning. It is reported that 6.20 inches of rain was recorded at Easton during the storm, while north of that town to Bangor, unofficial readings up to 8 and 9 inches were found. The concentration of rain caused rivulets to become raging streams, and streets flowing creeks, resulting in a great amount of erosion and deposit of silt, stones, and rubble to a depth of 3 feet, as velocity decreased. The Aquashicola Creek was highest in 44 years of record; others in the storm area were not so high, and there was no flooding on the Lehigh or Delaware Rivers. Bath was entirely flooded by the Monocacy Creek, and sanitary conditions became acute. At Northampton the water works was damaged. Bangor and Nazareth also suffered seriously from the elements. Firemen, in Easton alone, answered 10 alarms due to lightning striking various structures. The railroads had a number of washouts. Just prior to this storm, Boalsburg, Center County, experienced a severe hailstorm of passing note at 5:00 p. m. Stones were reported 2 to 2 1/4 inches in diameter, and a few compound stones as large as 4 inches.

Nature, not content to rest on the laurels of rainfall records, plummeted the morning temperature of the 12th to new July minima at several stations, and quite generally to lows equalling records standing up to 50 years.

By mid-July the pressure systems were definitely arranged in such a manner as to again produce heavy rains over the eastern half of the State. The persistency of this pattern for many weeks led many skeptics to momentarily reconsider the veracity of St. Swithin's legend, but greater confidence should have been placed in the old proverb, "During wet weather it rains without half trying." Downpours of 3 to 4 inches of rain were prevalent on the 14-15th, 18-19th, 22d, and 28-29th. Scranton suffered in the first of these. By the 18-19th, the Schuylkill and Lehigh Rivers were swollen, but confined to their banks, although creeks in several counties caused isolated flooding. The third series of these storms, those of the 22d, caused more than a quarter million dollars damage in the southeastern counties, and particularly at Elizabethtown and Robesonia. Many other storms of note occurred, that space will not permit detailing, but we cannot pass without two final references. On the 28th, a storm deposited 3.52 inches of rain at Johnstown in 90 minutes, stalled traffic, and filled streets with silt The unique tradition that rain will fall at Waynesburg on July 29th was fulfilled Only three times by "oral or written records has rain failed to fall on the 29th, in that community, in the past 69 years."

TEMPERATURE.

The average temperature for the State as deduced from the reports of 85 stations was 70.4°, which is 1.8° below the 58-year normal for July. The highest monthly mean was 77.8° at Marcus Hook, and the lowest was 65.2° at Kane. Extremes ranged from a maximum of 103° at Marcus Hook on the 1st, to a minimum of 32° at Philipsburg on the 12th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 204 stations, was 5.75 inches, which is 1.47 inches above the 58-year normal for July. The greatest monthly amount was 17.89 inches at Wild Creek Reservoir, Carbon County, while the least was 1.62 inches at Mercer and Farrell. The greatest amount recorded in any 24 consecutive hours was 5.33 inches at Wild Creek Reservoir on the 9-10th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
a, b, c, etc. Number of days missing, for example, b indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
‡ And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

L. F. CONOVER

HARRISBURG, PA.

VOL. L. AUGUST 1945. No. 8.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

This was the driest month since February, although the State average was barely below normal. The accumulated precipitation since January 1 is +2.66 inches, or 5 inches more than at the same time last year. Slightly more sunshine and 5 less rainy days made the month a pleasant contrast to the stormy, dreary weather of July. A few localities in the west and north-central counties remained extremely dry. Totals for Beaver Falls and Galeton were the driest for August in 37 and 15 years of record, respectively.

The July pattern opened the month. Early on the first, excessive precipitation in Delaware County caused creeks to overflow, locally flooding homes and war plants near Chester. There followed several dry, sunny days, the first in a number of weeks, and permitted one good haying and harvesting day. It was too good to last; by the 6th rain was general, and thunderstorms, with more local flooding in the Philadelphia area, followed on the next day.

The next two weeks were relatively the longest rain-free period this year (averaging less than 0.50 inch), but on the 23d general rains began in the eastern counties and extended west by the 25th, when a damaging squall line formed in the central part of the State. About $100,000 of wind damage occurred at Lock Haven. In Harrisburg, due to the sudden violence of its passage, numerous trees were blown down with resultant minor structural and power-line damage. Temperatures reached their lowest points for the month on the 27th and climbed quickly to register their highest points on the last two days.

The meteorological summer, closing with the current month, averaged 68.8° or 1.4° below normal, the coolest since 1927. Rainfall averaged 13.61 inches or 108% of normal. However, the western portion of the State received only 93% of a 36-year average, while the east experienced 122%. This distribution of precipitation further emphasizes the trend begun in April. Accumulated departure for the growing season April 1 to date now shows several areas with deficiencies. They are in Tioga and Clearfield Counties and from Crawford-Venango southward including Greene-Fayette-Somerset Counties, with the exception of portions of Westmoreland and Washington. The largest deficiency in this area is 4.57 inches at Greenville. Elsewhere excesses are shown, reaching 16.25 inches at Mt. Pocono and averaging about 9 inches generally east of the Susquehanna River. The moisture benefited vegetation, but interfered with all field work. In spite of all handicaps, yields promise to be better than average, except for fruits.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 69.3°, which is 1.0° below the 58-year normal for August. The highest monthly mean was 76.0° at Marcus Hook, and the lowest was 62.8° at Kane. Extremes ranged from a maximum of 99° at Marcus Hook on the 30th and at Phoenixville on the 31st, to a minimum of 34° at Greenville on the 27th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 203 stations, was 3.79 inches, which is 0.37 inch below the 58-year normal for August. The greatest monthly amount was 8.52 inches at West Grove, while the least was 0.78 inch at Beaver Falls. The greatest amount recorded in any 24 consecutive hours was 3.42 inches at Dingmans Ferry on the 23d-24th.

OBITUARY

Mr. J. H. Weinberger, cooperative observer at Zionsville, Pennsylvania, died on July 5, 1945. His services began on December 1, 1931, and continued until the time of his death.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

GENERAL SUMMARY.

Rain. Rain. Rain. Fourteen days with rain, and heavy amounts at that, made this September the third wettest since 1889 and also closed the growing season with the third highest total. Although the latter two values have been exceeded twice by slight amounts, the number of rainy days has not been, and the three values in combination just aren't experienced much wetter! Fortunately, the mean temperature (63.4°) for the growing season was only a half degree below the average. Substantial rain and normal temperatures favored crops. Early estimates of the Crop Reporting Service indicate that production and yield were generally above the 1934-43 year averages, only potatoes and fruits showing marked reductions due to weather causes. The rainiest area during the period April through September was Luzerne County. Wilkes-Barre received 192% of the normal precipitation; Scranton, in Lackawanna County, 171%. The least rain was received at Greenville, Mercer County, with 90% of normal, and at Somerset, 96%. The average for all areas was 125% and was exceeded only during the growing seasons of 1889 and 1933.

The majority of stations reported the highest temperature of the month on the first. Heavy thunderstorms were general that evening. Near Wilkes-Barre a young man was drowned in attempting to cross a foot bridge over a swollen stream. Water, wind, and lightning damage was general in that area from two storms. Two men were electrocuted in Lebanon County while trying to remove a fallen tree from the highway. The 2d to 8th was the driest period of the month, and the last two days of the period nearly as warm as the first, as some stations experienced their maxima for the month on these dates. A paradox to the theme of wet weather came from the small community of Avella, Washington County. Conditions there grew so acute that the rationing of water was required. Elsewhere in the County, farmers were reporting crops suffering from lack of moisture and extended heat. Storms on the 9th, 10th, and 11th replenished water supplies, soil moisture, and at a number of places caused additional damage by wind, lightning, and local flooding. This was particularly true in the vicinity of Ephrata and Pottstown.

Two tornadoes occurred on the 14th. The first formed in West Virginia about 3 p. m. and traveled into Aleppo Township, Greene County, causing $10,000 property and crop damage. The second occurrence was in the vicinity of Rockton, Clearfield County, about an hour later, causing some $30,000 property and crop damage. There were no personal injuries or deaths.

A northeaster, having an origin as a hurricane that caused extensive damage in Florida, produced strong winds and copious rains on the 17-19th. Threat of flooding ended when the streams in the eastern portion of the State crested under bankfull. As high pressure areas drifted eastward on the 22d and 30th, monthly minima were recorded. A few stations reported freezing temperatures and frost damage on the latter date.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 65.9°, which is 1.7° above the 58-year normal for September. The highest monthly mean was 73.2° at Marcus Hook, and the lowest was 59.4° at Kane. Extremes ranged from a maximum of 96° at Phoenixville on the 1st and at Farrell on the 6th and 7th, to a minimum of 29° at Coudersport and Wellsboro on the 30th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 200 stations, was 6.42 inches, which is 2.97 inches above the 58-year normal for September. The greatest monthly amount was 10.39 inches at Wilkes-Barre, while the least was 3.42 inches at Marcus Hook. The greatest amount recorded in any 24 consecutive hours was 3.90 inches at Coatesville on the 17-18th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon

List of Changes in Station Designations

VOL. L. OCTOBER 1945. No. 10.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

The past month of October—usually a pleasant and invigorating period between summer and winter—was, this year, on the coolish side, with more than the average number of rainy days, the low temperatures and rainy days being concentrated particularly in the first half. In the last half of the month, many excellent days were a welcome relief—although by the close, the daytime maxima approached the records for high temperatures so late in the season, while new early season lows occurred at the beginning. Such features are now nothing more than routine, since 1945 continues to reveal unusual and contrasting conditions as each month develops.

Precipitation for the State as a whole was less than normal, but stations in most northwestern counties recorded the wettest October in twenty years. These high values, five to six inches and over, have mostly overcome the deficiencies accumulated in that area since the first of the year. The accumulated excess for the State for the first ten months is now 5.13 inches.

Heavy rain on the first two days of the month, particularly in the Ohio River Basin, caused some local flooding in Erie County, and moderate rises on the Allegheny River. The first traces of snow were noted on the third. This date is rather early, although in 1942, 1943, and four other years, first reports of snow came in late September. The following morning, freezing temperatures were quite general throughout the State, closing the growing season. Thermometers at some stations southeast of the mountains recorded the lowest temperatures of record for so early in the fall season. The first significant snow fell on the 8th and 9th in the north-central counties, while heavy rain fell elsewhere. Until the sixteenth, with cloudy skies and low temperatures prevailing, the conditions resembled the raw weather of early November. Thereafter, the days were clear and mild, with the exception of the stormy 24th-25th. The warmest day of the month was the 19th, but maxima on the closing days were so high that hunters were fearing it would be too hot to hunt, when the season opened on November 1.

The number of forest fires reported to Forestry officials during the month reached a new 20 year low.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 51.0°, which is 1.5° below the 58-year normal for October. The highest monthly mean was 60.2° at Marcus Hook, and the lowest was 45.1° at Kane. Extremes ranged from a maximum of 85° at Donora and Hewitt on the 1st, and at Marcus Hook and York on the 19th, to a minimum of 20° at Philipsburg on the 11th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 201 stations, was 2.75 inches, which is 0.52 inch below the 58-year normal for October. The greatest monthly amount was 6.96 inches at Pennline, while the least was 0.50 inch at Hyndman. The greatest amount recorded in any 24 consecutive hours was 2.25 inches at Erie on the 1st-2d.

The average snowfall for the State was a trace, which is 0.2 inch below the 58-year normal. The greatest monthly snowfall was 0.5 inch at Monroeton. The greatest fall for any observational day was 0.5 inch at Monroeton on the 14th.

ERRATA

September, 1945.—Page 68, Home, precipitation on the 28th should be 0.00, on the 29th, 0.07 inch.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
a, b, c, etc. Number of days missing, for example, b indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

Dauphin	formerly	Peters Mountain Tower

CLIMATOLOGICAL DATA

32 PENNSYLVANIA SECTION

L. F. CONOVER

HARRISBURG, PA.

VOL. L. NOVEMBER 1945. No. 11.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

This was the wettest November since 1921, and in the eastern counties, the wettest since the 90's. But only in 1921 were there as many days with measurable precipitation. Snowfall for the State as a whole was slightly below normal. However, stations in and near Tioga County reported the heaviest fall for any November in a half century of records. The persistance of precipitation during the month, normally the driest of the year, was the result of secondary storms developing on the eastward passage of more than the normal number of Lows past Pennsylvania. The secondaries travel northeastward up the coast, hence the predominance of heavy precipitation in the eastern counties. Fortunately, not very much cold, polar air was drawn southward as they formed, and the temperature for the month averaged close to normal.

The wet months of September and November were directly reflected in autumn's total of 14.42 inches of precipitation. This is third only to those of 1926 and 1889, 14.81 inches and 15.62 inches, respectively. The temperature for the three month, fall period was 53.0°, or 0.3° above average, although killing frost early in October shortened the growing season.

The pleasant weather of the first was short-lived, for, during the 2d and 3d, two frontal systems passed across the State quickly, producing heavy precipitation in northern counties, and were followed by unseasonably low temperatures the next two days. The sixth was notable as the only clear day reported by all stations during the month, and the beginning of a warm period that lasted, with but one brief interruption, until the 20th. Monthly maxima were reported on the 7th and 9th, while the lowest temperatures occurred irregularly during the remainder of the month, some during the warm period when nighttime radiation was favored.

Thanksgiving Day (22d) ushered in the first real signs of winter. High winds attending the passage of another, now familar, frontal system, caused damage in the Philadelphia and and Wilkes-Barre areas. In Pittsburgh the next day, a lad slipped on a hillside coated with snow and ice, and was the first casualty of King Winter.

The big storm of the month came in the closing days. Beginning as rain on the 27th, and changing to snow on the 28th in the northern counties and heavy rain in southeastern counties, it produced 15 inches of snow at Lee Fire Tower, Tioga County, and 3.38 inches of precipitation at Philadelphia, the greatest November 24-hour falls of record for those stations. In Philadelphia several died in traffic accidents due to storm conditions; damage resulted from wind and flooding. Although officially three weeks away, winter had an energetic start.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 42.0°, which is 0.7° above the 58-year normal for November. The highest monthly mean was 51.0° at Marcus Hook, and the lowest was 36.0° at Kane. Extremes ranged from a maximum of 85° at Marcus Hook on the 9th, to a minimum of 5° at Corry on the 27th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 198 stations, was 5.25 inches, which is 2.35 inches above the 58-year normal for November. The greatest monthly amount was 8.20 inches at Newburg, while the least was 2.26 inches at Austinburg. The greatest amount recorded in any 24 consecutive hours was 3.38 inches at Philadelphia City Office on the 28-29th.

The average snowfall for the State was 2.4 inches, which is 0.3 inch below the 58-year normal. The greatest monthly snowfall was 17.0 inches at Lee Fire Tower, Tioga County. The greatest fall for any observational day was 15.0 inches at Lee Fire Tower on the 28-29th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

Dauphin	formerly	Peters Mountain Tower
Farrell	"	Sharon
Ford City	"	Crooked Creek Dam
Grantville	"	Manada Gap
Hawley, 1 S.	"	Wallenpaupack Dam (Evaporation)
Jamestown	"	Pymatuning Dam
Kregar	"	Laurel Hill Tunnel
McConnellstown	"	Loop Mountain Tower
Milroy	"	Penn Nursery
Monroeton	"	Kellogg Mountain Tower
Neffs Mill	"	Shaver Creek (Evaporation)
Newburg	"	Blue Mountain Interchange
Putneyville	"	Mahoning Dam
Sheffield	"	Cherry Grove
Tyrone	"	Bald Eagle
Williamsport 4 SE	"	Shaffers Path

L. F. CONOVER

HARRISBURG, PA.

VOL. L. DECEMBER 1945. No. 12.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Like that of December 1942 and 1944 this was an "old fashioned" winter month. The fact that it was the fifth coldest and fourth snowiest should dispel any lingering thought that our winters have moderated permanently. This type of weather results when air of Arctic origin invades central and eastern states, and is renewed frequently by new outbursts. The leading edge of the cold air, known as the polar front, must be south of Pennsylvania so that the State is in a colder area. Then storms move easterly, along the polar front or warm-moist air moves northward over the colder wedge of air. In either case, frequent moderate to heavy snows result with little or no melting.

To be significant, this condition must persist for a period of two weeks or more, but rarely does it continue more than six weeks. The current cold-snap had a preview in late November that began to wane by the fifth as freezing rain, over most of the State, made roads and walkways treacherous to travel upon and resulting in the first of numerous waves of collisions, upsets, accidents, and traffic fatalities that occurred during the month, perhaps the largest number of record.

Moderating temperatures produced the highest marks for the month on the 8th and 9th. Then a heavy snow mantle began to accumulate on the ground and an ice sheet on the streams, under a sustained cold period of two weeks.

A total eclipse of the moon on the evening of the 18th, the first visible in Pennsylvania since August 1942, was mostly obscured, except for a few brief glimpses through the cloud deck preceding the heaviest snowfall of the month. Fortunately, the snowfalls were not of record-breaking proportions nor did wind drift it to any great extent, blocking roads and paralyzing traffic as in the previous December.

Lowest readings of the month, generally sub-zero, except in the southeastern counties, were recorded on the 16th-18th, 23d and 24th. As the latter readings were being made, forecasters saw the conditions developing that spelled relief from the subnormal weather. Warm-moist tropical air began streaming northward from the Gulf of Mexico, up the Mississippi River Valley to envelop the northeast. As this airmass was first lifted above the colder surface air, the resultant precipitation on Christmas Day began as snow, then changed to sleet and freezing rain and finally, at least in the eastern counties, to heavy rain. The long anticipated "White Christmas" was considerably dampened. Conditions were horrible —icy roads made travel an adventure; the snow was reduced to slush, creating sizeable puddles and swelled the streams. Sufficient runoff occurred to flush the streams of their ice burden without creating flood conditions—an extremely fortunate occurrence.

More normal weather obtained for the closing days of the year but with its full share of snow, sleet and rain. On New Year's Eve, the skies cleared of storm and strife, our hopeful wish this be an omen that 1946 will have more stable weather and better living.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 25.6°, which is 5.6° below the 58-year normal for December. The highest monthly mean was 36.0° at Marcus Hook, and the lowest was 20.1° at Kane. Extremes ranged from a maximum of 62° at Marcus Hook on the 9th, to a minimum of —22° at Ridgway on the 23d.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 202 stations, was 2.73 inches, which is 0.36 inch below the 58-year normal for December. The greatest monthly amount was 5.92 inches at Philadelphia, Shawmont, while the least was 1.13 inches at Austinburg. The greatest amount recorded in any 24 consecutive hours was 2.40 inches at Mount Pocono on the 25th.

The average snowfall for the State was 16.6 inches, which is 8.5 inches above the 58-year normal. The greatest monthly snowfall was 33.8 inches at Corry. The greatest fall for any observational day was 18.6 inches at Hawley on the 19th.

ERRATA

Annual, 1940, page 74, Claysville, total precipitation should be 43.78 inches; page 76, Claysville, annual precipitation should be 43.78 inches, departure should be +3.48 inches.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

HARRISBURG, PA.

VOL. L. ANNUAL SUMMARY 1945. No. 13.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

On forty-four percent of the days (161) in 1945 there was measurable precipitation, which was 20 days more than occurred in any other year. With measurable amounts almost every other day, the accumulated fall was the greatest total since 1889 and 1890. The distribution of annual precipitation by stations shows a deficiency of 5% at Greenville and Somerset. Elsewhere totals ranged from 110-130% of average, rather uniformly, with values above 140% reached in Luzerne, Lackawanna, Monroe, Wayne, and Pike Counties.

The annual temperature was about normal, but the seasonal means fluctuated greatly. The winter of 1944-45 was the coldest since 1920; spring, the warmest in 24 years; and summer, the coolest in 21 years. The growing season and autumn were only slightly below average.

The unseasonable warmth of March and early April accelerated plant growth and farm work, bringing prospects for a productive crop. Late frosts in April and May sharply reduced fruit yields. Wet weather hindered crops until after harvest time; all but corn, which thrived, and a few other grains showed decreased yields. Ample moisture helped establish a new low mark for the number of forest fires.

WEATHER BY MONTHS

JANUARY: Snow, wind, and cold predominated — it being the fourth snowiest and sixth coldest. So severe were conditions, that many rural roads were closed most of the month; war production was curtailed, and overtaxed heating systems caused numerous serious fires. Icy roads and streets limited automobile traffic, necessitating foot traffic, and, as a consequence, it is probable there were more fractured bones from slipping and sliding than in any similar period.

FEBRUARY: Anxiety concerning probable floods as the valleys released their heavy snow burden predominated. Fortunately, with mild and relatively dry weather, the snow disappeared gradually with no serious flooding. The river crest at Pittsburgh was only three feet above flood stage, while elsewhere rivers were confined to their banks.

MARCH: It entered like a lamb and that it was. Warmer than 44% of all *April* records and somewhat wetter than average produced rapidly fluctuating streams, although of no serious consequence, except on the Susquehanna River at Marietta, where an ice gorge backed up water to a level above that of the March 1936 flood. Vegetation was 3 weeks to a month ahead of normal.

APRIL: Abnormally warm weather, continued from March through the first half, was followed by a reaction to cold and wet the latter portion of the month, which proved of serious consequence to vegetation in all but the southeastern counties. While agricultural prospects were most promising at the beginning, frosts and above average rainfall greatly nullified this progress.

MAY: The coolest in 21 years and snowiest in 23 years, after balmy March and early April, amply justified the remark that "it was a short summer." A nine-inch snow in Bradford County and a tornado in Centre County highlighted an action-filled month of damaging storms and cold.

JUNE: As April conditions followed the previous month, so with June. It opened with snow traces, the third occurrence in 58 years! Low temperature records were broken before warm weather established itself after the 10th and continued the remainder of the month, although the deficiencies accumulated for the first ten days were not offset. Violent thunderstorms, some accompanied by damaging hail, were general the latter half.

JULY: A very rainy month, 21 stations reported new July, and 9 others, new all-time records. Damage running to millions of dollars was caused by the thunderstorms that frequently approached cloudburst proportions.

AUGUST: A pleasant contrast to the stormy, dreary weather of July. Several stations in the west and north-central counties reported the driest August of record, but the State average precipitation was only slightly below normal. The mean temperature was again below normal.

SEPTEMBER: Two small tornadoes on the 14th in Greene and Clearfield Counties; the first month since April with the mean temperature more than normal, but did not offer compensation for the raininess of the third wettest September of record. Paradoxically, water was rationed in one Washingtown County community, due to deficient rainfall in that area.

OCTOBER: The growing season closed on the 4th with frosts general on that date as thermometers recorded the lowest temperatures for so early in the fall. As the month closed, the daytime maxima temperatures approached the record highs for so late in the season, but the mean was below normal. Precipitation was also below normal despite stations in most northwestern counties reporting the wettest October in 20 years, which overcame the deficiencies accumulating in that area since the first of the year.

NOVEMBER: This is normally the driest month of the year, but it was the wettest of all in 1945. The 6th was the only clear day reported by all stations. The big storm of the month began on the 27th. Before it was over, it broke the 24-hour rainfall record for the month at Philadelphia, and the 24-hour snowfall record for stations in and near Tioga County.

DECEMBER: The records for the month are a repetition of January, and further emphasize the fact that real winter weather is an ever present threat to Pennsylvania. This was the fourth snowiest and fifth coldest, but wind was not a significant feature, eliminating the drifts that interfere with transportation. However, several glaze storms produced about the same effect.

L. F. CONOVER
HARRISBURG, PA.

VOL. LI. JANUARY 1946. No. 1.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

The month was a pleasant respite from the rigorous winter months experienced in the past few years. The average temperature was only one degree above normal, but the average total precipitation for the State was the lowest for 59 years of record. As a consequence of this warmth and dryness, snowfall was half of normal, all three elements making it an "open" winter month, typical of about a third of those on record.

A gradual warming occurred until near-record highs, in the middle sixties, were reached rather generally over the State on the 6th. The "January thaw" removed all the remaining snow of December, except that caught in crevices and crannies on the north slopes of the mountains in the northern counties. Augmented by some rain, the melting snow produced swollen rivers, sufficient to remove the ice from main stream channels, with no significant jamming. Lowlands on the smaller tributaries were flooded during this period but, fortunately, flood stages were not reached. The Ohio River crested at 22 feet, 3 feet under flood stage at Pittsburgh.

After an interval of nearly four weeks, winter conditions returned by the 20th for a brief period. The coldest day this winter was followed the next day by snow, then rain, which formed a thick ice coating over most of the State. Pedestrian and vehicular traffic were considerably interrupted; many injuries were reported from slipping or collision. By the morning of the 23d, the full force of Arctic air was again felt in the State. Sub-zero weather was general except southeast of the mountains, and the lowest temperature so far this winter was recorded.

Another snow and ice storm set in on the 25th, producing hazardous traffic conditions through and east of the mountains. High wind and the texture of the snow in the Pymatuning Lake area of Crawford County was suitable, that night, to produce a rare phenomenon — snow rollers. As residents of the area arose in the morning, they saw, as the observer at Linesville, Miss Retta M. Crumb, remarked, "—thousands of snow balls ranging in size from six inches to two feet in diameter." These snow rollers are formed by the wind picking up a bit of snow and rolling it along the ground, accumulating snow as it is "pushed" along by the wind, and in the same manner as a child makes the three portions of a snowman.

Although the ground was bare most of the month, winter grains fared well. Many of the winter chores have been performed, due to the favorable weather conditions.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 29.2°, which is 1.0° above the 59-year normal for January. The highest monthly mean was 39.9° at Marcus Hook, and the lowest was 22.7° at Montrose. Extremes ranged from a maximum of 75° at Donora and Marcus Hook on the 6th, to a minimum of —27° at Emporium on the 23d.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 205 stations, was 1.36 inches, which is 1.77 inches below the 59-year normal for January. The greatest monthly amount was 2.76 inches at Kregar, while the least was 0.40 inch at Austinburg. The greatest amount recorded in any 24 consecutive hours was 1.20 inches at Uniontown on the 7th.

The average snowfall for the State was 5.0 inches, which is 5.5 inches below the 59-year normal. The greatest monthly snowfall was 17.2 inches at Corry. The greatest fall for any observational day was 9.5 inches at Buffalo Mills on the 20-21st.

ERRATA

Annual, 1945.—Page 99, annual precipitation at Coalport should be §44.31.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

Neffs Mill formerly Shaver Creek (Evaporation)

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

HARRISBURG, PA.

VOL. LI. FEBRUARY 1946. No. 2.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

February was close to being as typical a Pennsylvania winter month as one will find in the records — since there is no "normal" weather. This statement is made since our normal weather is nothing more than the average of a series of weather records, none of which exactly fits the specifications of all elements of temperature, precipitation, wind, cloudiness, etc. The month was just a little warmer than most records show; precipitation was only slightly deficient, and the snowfall was about that to be expected.

Another meteorological winter was closed with the February records. Reviewing, December was severe, January mild, and as stated above, February was nearly normal. The temperature averaged 28.0°, or 1.4° deficient; precipitation was 6.42 inches, or about a month's total short of average, while the snowfall was less than an inch under the three month average of 29 inches.

Being typical, February had its full share of wind, rain, ice, cold, and snow. On the 2d an isolated snowfall blanketed York County, without producing enough to cover the ground along the county line.

High pressure over the northeastern states, and warm, moist, tropical air overrunning it, caused rain on the 5th and 6th, which froze as it fell, producing hazardous ice conditions over a large portion of the State. Numerous accidents were reported on these dates.

St. Valentine's Day offered a great variety of weather. Beginning in the early morning, strong southwesterly winds, reaching gale velocities in gusts, toppled trees, broke window glass, unroofed barns, and smashed silos. Riding in on the southerly winds, the temperature crowded the sixty degree mark, only to be plummeted to low readings near zero in the next 24 hours, as cold Arctic air was carried southward by equally strong northwest winds. Heavy showers gave way to snow, four inches deep in some sections. Many western stations reported the highest and lowest temperatures of the month on these two dates, a fall of more than 50° in less than twenty-four hours.

One of the heaviest snowfalls of the winter struck suddenly on the 19th. The eleven-inch fall at Harrisburg was the heaviest February fall since 1921. Western and extreme southeastern sections did not receive the full brunt of the storm, and in the latter area, the precipitation was mostly in the form of rain, or at least snow melting as it fell. Twelve to eighteen inch falls were reported from the mountainous areas. Unfortunately, the two following days were windy. Drifting occurred, and in many sections, roads were blocked. However, a return to warmer weather and rain caused bare ground to be showing over most of the State by the close of the month.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 86 stations was 29.3°, which is 0.9° above the 59-year normal for February. The highest monthly mean was 40.2° at Marcus Hook, and the lowest was 22.2° at Eagles Mere. Extremes ranged from a maximum of 75° at Marcus Hook on the 27th, to a minimum of −14° at Emporium on the 4th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 215 stations, was 2.33 inches, which is 0.47 inch below the 59-year normal for February. The greatest monthly amount was 3.71 inches at Mt. Pocono, while the least was 0.85 inch at Lawrenceville. The greatest amount recorded in any 24 consecutive hours was 1.88 inches at Mt. Pocono on the 19-20th.

The average snowfall for the State was 9.7 inches, which is 0.9 inch below the 59-year normal. The greatest monthly snowfall was 23.2 inches at Lakeville. The greatest fall for any observational day was 20.0 inches at Lakeville on the 19-20th.

ERRATA

July, 1945.—Page 51, State College, precipitation on 15th should be 0.21 inch.

VOL. LI. MARCH 1946. No. 3.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Only March 1921 and 1945 were warmer than the current one, and they, as record highs, were only slightly warmer. Extreme western stations, rather generally, and Freeland and Montrose in the east reported the highest March mean temperatures of record. This is the first occurrence in 59 years of record where one exceptionally warm March was followed by another having the same unusually high temperature. A logical consequence of the warm weather has been the absence of snow. The monthly average was the least for March since 1903 and is the second lowest of record. The month was favorable for plant growth. Although fruit trees are not quite so far advanced as last year, they are, at the close of the month, about four weeks early and show more consistent development throughout the State. Under the most favorable conditions farmers have made greater strides in plowing and seeding this year. However, cautious expectation was the keynote, since damaging April frosts are always a definite threat to an early season.

Rivers were rising as February closed, and they were cleared of ice by the first days of March. Moderate rains between the 6th and 9th, augmented by the melting of the little snow remaining at that time, caused the rivers to rise to their crests for the month. Fortunately, they were under flood stage, and another spring freshet season was at end without serious flooding.

The storm of the 9th was the most violent experienced during the month, as a low pressure system, forming in Kansas, moved northeastward rapidly. Its attending cold front with strong winds, upon crossing the State early that day, left minor destruction at a large number of places. Reports were received of a two-room dwelling being overturned with one of its occupants in it at Hardwich, Allegheny County; the roofs of five barns were ripped off in the vicinity of Center Hall, Center County, and many other reports of minor damage and fallen trees areas in the southeastern counties.

A secondary highlight to that of the warmth of the season were the auroral displays of the 23d to 28th. That of the 23d was unusually active and brilliant in its early stages—shortly after evening dusk—showing much red, finally green, and at times extending into the southern portion of the sky. The display of the 28th noticeably affected communication facilities. The aurora borealis in its full splendor is not too frequently seen from our well-lighted cities in the State, and its cause is even less comprehended. The most common explanation given for auroras is that electric discharges associated with, and probably from, sunspots during their maximum activity reach the rarified air at an average altitude of 60 to 70 miles. The discharge illuminates this region and we see its manifestation taking the form of red, yellow, green, and even white arcs or arches, parallel bands or rays and curtains, seemingly emanating from a point near the northern horizon. The fan-shaped effect is attributed to the phenomenon of perspective, as one looking along the railroad tracks sees them converge on the horizon. The electric discharges reach the earth and interrupt the earth's magnetic field, the voltage of which is known, and to which all telegraphic equipment is adjusted. Thus, the aurora throws the electrical circuits of this type of equipment off balance, and considerable publicity is given the failure of communication facilities during periods of auroral display—or should we say sunspot activity?

TEMPERATURE.

The average temperature for the State as deduced from the reports of 86 stations was 47.1°, which is 9.3° above the 59-year normal for March. The highest monthly mean was 53.0° at Donora, and the lowest was 41.4° at Kane. Extremes ranged from a maximum of 84° at Emporium on the 28th, to a minimum of 6° at Hawley and Kane on the 1st and 10th, respectively.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 216 stations, was 3.18 inches, which is 0.34 inch below the 59-year normal for March. The greatest monthly amount was 5.17 inches at Williamsport(4SE), while the least was 0.73 inch at Austinburg. The greatest amount recorded in any 24 consecutive hours was 1.70 inches at West Newton on the 14-15th.

The average snowfall for the State was 0.3 inch ,which is 7.4 inches below the 59-year normal. The greatest monthly snowfall was 2.5 inches at Kane. The greatest fall for any observational day was 1.5 inches at McConnellstown, Tamarack, and Williamsport(4SE) on the 2d, Curwensville on the 9th, and Freeland on the 11th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

This was the driest April of record, with the average precipitation, 1.19 inches, only 35% of normal and 75% of the previous record low average for April, 1.57 inches, which was established in 1900. High pressure systems maintained a flow of cool, dry air over Pennsylvania most of the month and cyclonic systems produced less precipitation than usual, due to the swift passage of their centers far to the north or south of the State. This was the fifth consecutive month with sub-normal precipitation. The year, to date, is the second driest of the period of record, with an accumulated total for the first four months of 8.06 inches. Only 1941 was drier, having a total of 7.78 inches for the same period.

After the rapid advance of vegetation during March, frost was a constant danger. It materialized on a number of days, doing its most serious damage in commercial fruit areas on the 11th and 28th. Fortunately, cool temperatures had retarded vegetal growth, so that frost damage was lessened.

A low pressure system, developing as a wave along an advancing edge of cold air over the west Gulf States, produced greatest 24-hour measurements at many eastern stations as it passed up the Atlantic Coast about the 26th. These amounts were important only in that they were more than half the month's total at about 50% of the affected stations. In north-central and northeastern counties, precipitation in this storm fell as snow, producing the only significant measurements of the month. Minor wind damage occurred in the southwest counties on the 4th during the passage of a deep low, moving northeastward from Colorado.

The lack of rain became increasingly serious, and drought conditions were developing in the southeast at the close of the month. The ground became hard, and farmers were forced to delay completion of plowing and planting. Forest growth, which had been ahead of normal, dried out, presenting a dangerous fire hazard. Forest and brush fires were more numerous than usual, but constant vigilance and quick action by fire-fighting crews kept losses low. Rivers were at low levels throughout the month.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 85 stations was 47.8°, which is 0.8° below the 59-year normal for April. The highest monthly mean was 52.8° at Philadelphia City Office and the lowest was 40.6° at Kane. Extremes ranged from a maximum of 88° at Hewitt on the 22d and at Burnt Cabins, Columbia, and York on the 23d to a minimum of 13° at Kane on the 11th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 217 stations, was 1.19 inches, which is 2.22 inches below the 59-year normal for April. The greatest monthly amount was 2.78 inches at Donegal, while the least was 0.49 inch at Lewistown The greatest amount recorded in any 24 consecutive hours was 1.25 inches at Newell on the 23d.

The average snowfall for the State was 0.3 inch, which is 1.8 inches below the 59-year normal. The greatest monthly snowfall was 4.8 inches at Eagles Mere. The greatest fall for any observational day was 4.8 inches at Eagles Mere on the 26-27th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

This was the wettest month since August 1933 and was exceeded by only one May record, that of 1894. Thus there is nothing strange that record breaking floods were associated with the period, nor that the heavy precipitation followed the driest April of record. This sequence of very wet following very dry months has occurred a number of times; as for example, March-April 1903, May-June 1903 and 1928, August-September 1894 and September-October 1943.

There were 26 long established stations and 38 others of less than 20 years record that reported a month's total exceeding any previous May. Outstanding among these are the 61 years at New Castle, 59 years at York, and 58 years at Selinsgrove. Despite these records and the fact that 16 stations, particularly in the eastern half of the State received 10 or more inches of rainfall — 30% to 50% falling between the 26th and 29th, the months of May 1889 and 1894 were overshadowing monuments of rainfall and floods. With only 5 or 6 interruptions of 24 to 36 hours rainfall was reported rather generally, particularly in the Susquehanna River Basin, from May 5th to 22d. These rains set the stage for the floods that formed close to the 57th anniversary of the great Johnstown Flood.

It was the excessive rainfall of May 27th, caused by a slow moving low pressure area crossing the central portion of the State that produced the most serious flooding of record in portions of Lycoming, Tioga, and Bradford counties. However, flood stages were exceeded generally on the Susquehanna River and at scattered points on the Ohio and Delaware Rivers, but to a much lesser extent than in the north-central counties, where, as the waters receded, 12 deaths and millions of dollars damage were reported. These figures are much less than those of the great flood of 1936, principally because of the smaller areal coverage of the record floods and greatly improved warning systems. Many small towns, as Mansfield and Lawrenceville, in Tioga County, suffered more seriously than at any other time in their history. Soil erosion and crop loss harassed the farmers; 38 bridges and 16 miles of highways must be replaced in addition to repairs to many other bridges and inestimable miles of roadway.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 87 stations was 58.3°, which is 1.4° below the 59-year normal for May. The highest monthly mean was 65.4° at Marcus Hook and the lowest was 52.2° at Kane. Extremes ranged from a maximum of 92° at York on the 26th to a minimum of 23° at Kane on the 10th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 218 stations, was 7.25 inches, which is 3.28 inches above the 59-year normal for May. The greatest monthly amount was 11.80 inches at Sunbury, while the least was 3.02 inches at West Newton. The greatest amount recorded in any 24 consecutive hours was 5.39 inches at Renovo on the 26-27th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

HARRISBURG, PA.

VOL. LI. JUNE 1946. No. 6.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Eight deaths and property damage estimated at over a million dollars were attributed to weather causes during the wettest June since 1928, and the fourth wettest of record. Fed by locally heavy rain, rivers rose swiftly on several occasions and flood damage was serious in the Philadelphia area, northern Cambria County, and southwestern counties. Fortunately, the affected areas were relatively small and the floods were of short duration. Thunderstorms were frequent, and wind and lightning contributed to the loss of life and property.

Rain was general on the 1st and 2d and it appeared that not only May's rain, but also its floods, might be repeated. Greatest amounts fell over the southeastern counties, the greatest 24-hour rainfall of the month, 5.09 inches, being measured at Graterford. The Schuylkill and its tributaries overflowed and two people were drowned near Philadelphia, while property damage amounted to over $500,000. Much of this was due to the necessity of dredging the large deposits of silt and culm from the river channel. The Baltimore and Ohio Railroad station in Philadelphia was flooded, and traffic had to be re-routed temporarily.

Rivers also rose in the western part of the State, as a result of this storm, but flooding was generally restricted to low-lying areas. However, southwestern counties were hit harder. A child drowned in a swollen stream at Amity, and Uniontown had its first flood since 1936.

On the 13th, the upper reaches of the Susquehanna's West Branch overflowed, flooding communities in northern Cambria County. At Hastings a man was swept from a bridge and drowned. Property damage was heavy in Barnesboro, where stages were higher than in 1936, and other towns in the area. Local industries reported damage due to spoilage of stock and material by the floods. Mines were closed down for several days, as men could not get to work. Highways were damaged and a half mile of railroad track was washed out.

In Clearfield County continuous rains loosened earth and rocks, resulting in a rock slide on the 22d, which covered the railroad tracks near Viaduct. A freight train plunged into the slide, and one of the crew died as a result of injuries received. On the 29th a second flood struck the northern Cambria County communities which were still cleaning up the effects of the earlier flood.

Wind and lightning, accompanying thunderstorms, were severe and caused damage in all parts of the State. Near Greensburg a child was struck by lightning and killed during a storm on the 11th. Near Meadville, on the 26th, two people were electrocuted when they came in contact with a wire fence charged with electricity by a fallen power line. Power failures were frequent throughout the month, as a result of wind and lightning. On the 11th, thunderstorms seriously disrupted transportation in Altoona, while traffic on the Pennsylvania Railroad between Baltimore and Harrisburg was delayed when a signal block was knocked out. Slippery Rock experienced considerable wind damage on the 20th.

OBITUARY

John H. Friday, observer at Tyrone, 4 NE, died on April 24, 1946. His service as observer extended from the establishment of the station on August 19, 1937, until his death.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 86 stations was 65.8°, which is 2.4° below the 59-year normal for June. The highest monthly mean was 76.8° at Marcus Hook, and the lowest was 59.6° at Kane. Extremes ranged from a maximum of 100° at Marcus Hook on the 18th, to a minimum of 28° at Philipsburg on the 6th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 216 stations, was 6.05 inches, which is 1.89 inches above the 59-year normal for June. The greatest monthly amount was 11.22 inches at Carrolltown, while the least was 2.74 inches at Blakeslee Corners. The greatest amount recorded in any 24 consecutive hours was 5.09 inches at Graterford on the 1-2d.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).

[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.

Italics, data interpolated.

§ Partly interpolated.

§§ Incomplete.

† And other dates.

†† Daily amounts inconsistent.

‡ Received too late to be included in means and summaries.

* Included in next measurement.

// Windshield on gage.

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

HARRISBURG, PA.

VOL. LI. JULY 1946. No. 7.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

The mid-point of the meteorological summer has been reached and, as July was the fourth consecutive month with temperatures below normal, it appears that Pennsylvania is experiencing another cool summer. Although precipitation was just under the monthly normal, the growing season has had an excess of 2.72 inches. This combination has been favorable for the growth of corn, potatoes and tobacco, while tomatoes, grapes and most vegetables, have suffered. Generally, a long season (late frost) will be needed to offset the slow growth so far this year.

The frequency of thunderstorms was about one every other day, a rather high average. They were reported generally on the 1st-2d, 8th to 12th, 19th to 25th and 30th-31st. Four deaths from lightning occurred at widely scattered places, but damage from thunderstorms was not very great. Since the contrast of high surface temperatures and sub-freezing aloft was lacking, very little hail was reported.

After dusk on the evening of the 26th, residents of the Commonwealth witnessed another brilliant display of the aurora borealis, that had been preceded a few days earlier by observation of a huge sunspot crossing the sun. The northern lights reached a peak of activity and brilliance shortly after 10 p.m., as long streaks of white illuminated the sky southward beyond the zenith, while pink and purple tints colored the northern horizon. The display subsided before midnight, only to reappear about an hour later and achieve a new brilliance.

Another highlight was the rainstorm on the 31st in the vicinity of Wilkes-Barre. The Weather Bureau Office at the Wilkes-Barre Airport, Forty Fort, measured 7.62 inches of precipitation in 24 hours, and 5.55 inches was measured by the river observer in the city. These values constitute new, all-time records for the area. The bulk of the rain occurred in less than eight hours and caused much damage, as choked storm sewers could not handle the deluge. Cellars were flooded and traffic was tied up. Huge piles of silt were left, as the water drained off, and the area was cleaned. The residents had little time to prepare for flooding of this type in contrast to the preparation possible when the Susquehanna River goes on a rampage. Some stated that their damage was heavier than in a major flood. The river at Wilkes-Barre rose only three feet from a stage of 2.4 feet.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 85 stations was 70.7°, which is 1.5° below the 59-year normal for July. The highest monthly mean was 78.3° at Marcus Hook and the lowest was 63.2° at Kane. Extremes ranged from a maximum of 101° at Marcus Hook on the 7th to a minimum of 34° at Kane on the 16th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 212 stations, was 4.05 inches, which is 0.23 inch below the 59-year normal for July. The greatest monthly amount was 12.27 inches at Wilkes-Barre, while the least was 0.84 inch at Mercersburg. The greatest amount recorded in any 24 consecutive hours was 7.62 inches at Wilkes-Barre on the 31st.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
a, b, c, etc. Number of days missing, for example, b indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

GENERAL SUMMARY.

This was the second coolest August of record and the fifth consecutive month with deficient temperatures. The deficiency was the greatest of the year and reduced the accumulated average daily temperature excess for the year to 0.2°. Highest temperatures were recorded during the first decade. Except at southeastern and a few western stations, they were below 90°. Minima fell below freezing on the 25th and light frosts were reported in the closing days at scattered mountain and northern stations.

It was a dry month in the western counties. One large area in the northwest and a smaller one in the extreme west received less than two inches of rain. Greater amounts over the rest of the State raised the average to near normal. Precipitation was generally adequate until the last decade when light amounts accounted for only 12% of the month's total. Thunderstorms, occurring about every other day, were most general on the 26th, when hail fell at scattered stations. Depths ranged to over 3 inches near Doylestown and in the vicinity of Harrisburg. Crops and gardens were damaged, some being a total loss. Fog was more frequent and general than during July. On the 19th, three men were killed, one near Martinsburg, and two near Bernville, in airplane accidents during periods of poor visibility.

A tornado struck a rural community 11 miles south of Lancaster on the 19th and caused some damage to property and crops. Homes were unroofed, many trees were blown down, and fields of corn and tobacco were uprooted. One barn was moved from its foundation. No casualties were reported.

This was the fourth coolest summer of record and the coolest since 1927. In spite of the low temperatures, crops did reasonably well. The precipitation average was slightly above normal, due to June's excess, and heavy rain interfered with field work, locally. However, farmers took advantage of all favorable intervals and the harvest was well along, much plowing for fall seeding was done, and considerable seeding had been completed at the close of the month.

G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 86 stations was 66.9°, which is 3.3° below the 59-year normal for August. The highest monthly mean was 74.0° at Marcus Hook and the lowest was 58.8° at Kane. Extremes ranged from a maximum of 94° at Farrell and York on the 4th and at Marcus Hook on the 5th to a minimum of 30° at Kane on the 25th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 215 stations, was 3.87 inches, which is 0.29 inch below the 59-year normal for August. The greatest monthly amount was 7.30 inches at Virginville, while the least was 1.22 inches at Washington. The greatest amount recorded in any 24 consecutive hours was 4.95 inches at Berwick on July 31st-August 1st.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T, Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

32 PENNSYLVANIA SECTION

L. F. CONOVER

HARRISBURG, PA.

VOL. LI. SEPTEMBER 1946. No. 9.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

September was only 2.6° cooler than August, and the only month during the growing season with above normal temperatures. The seasonable temperatures, adequate sunshine, and only 7 rainy days provided a pleasant contrast to the weather in August, which was unseasonably cool and rather rainy. The normal drop in temperature from August to September is 6.0°.

Except for showers and thunderstorms around the 9th to 11th, generally fine weather prevailed, as slow-moving high pressure systems held control over Pennsylvania until the 20th. After the 20th, periodic surges of maritime tropical air from the Gulf and south Atlantic brought moderately heavy rain with breaks of only a few days until the end of the month, with considerable benefit to areas threatened with drought.

Thunderstorms were most frequent on the 10th and the 29th, as cold fronts passed across the State. On the 10th, during the passage of the squall line preceding the cold front, wind did extensive damage at Lock Haven. Two persons were injured. Buildings were damaged, several airplanes destroyed, trees blown over, and power lines torn down. Some communities in the area were without electricity most of the night. Hail, reported at scattered stations, was most general on the 29th. Wind and hail did some damage in the vicinity of Milton on the 8th, and in Beaver County communities on the 29th. Crops and gardens were damaged, and new seedings were washed by heavy rain. Snow flurries fell at scattered mountain and northern stations on the 30th, a relatively rare event, having occurred but 11 times in 59 years. Heavy fog was observed somewhere in the State on all but three days. A rather weak auroral display occurred on seven days in the last half of the month, causing interference with radio and telegraphic communications.

The warmer weather was of benefit to agriculture in the east portion, where maturing crops had been retarded by August's low temperatures. A few killing frosts were reported on the 4th and 15th. Until the 20th, the fine weather was excellent for field work and by the end of the month harvesting of most of the principal crops was well advanced.

The growing season has been cool and wet, due to the heavy rains in May and June. Temperatures were deficient by 1.5°, while precipitation was 2.28 inches above normal. The season was very favorable despite low temperatures, and the principal crops did well, especially grain crops which fared even better than last year.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 85 stations was 64.3°, which is 0.1° above the 59-year normal for September. The highest monthly mean was 72.8° at Marcus Hook and the lowest was 57.6° at Kane and Philipsburg. Extremes ranged from a maximum of 96° at Farrell on the 7th and at Chambersburg, Hewitt, Shippensburg, and York on the 9th to a minimum of 26° at Titusville on the 26th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 217 stations, was 3.30 inches, which is 0.15 inch below the 59-year normal for September. The greatest monthly amount was 7.27 inches at Mount Pocono, while the least was 0.92 inch at Union City. The greatest amount recorded in any 24 consecutive hours was 3.90 inches at Gettysburg on the 23-24th. A trace of snow fell on the 30th at Berwick and Somerset.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
• Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

HARRISBURG, PA.

VOL. LI. OCTOBER 1946. No. 10.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

The warm trend which began in September continued throughout October, and weather was ideal for enjoyment of the outdoors. Temperatures and sunshine were considerably above normal, with a record warm spell coming at the end of the month. Rainfall was above normal, so that pastures greened almost as in spring, saving farmers the cost of fodder.

It was the sixth warmest October of record. The month did not start warm. The first few days were below normal in temperature, but warmed up rapidly for a four-day spell of temperatures in the 80's, although the nights were cool. The middle of the month was cooler than normal for a few days, but the period from the 16th or 17th till the end of the month was very warm, in many cases averaging ten to twenty degrees above normal during the last week. The maxima of record for given dates were broken in various parts of the State. At Harrisburg, the maximum temperature on the 30th was the highest for so late in the season. At Philadelphia, a new record maximum for so late in the season was set on the 31st. Degree days at seven Weather Bureau stations averaged 62% of normal. Weather Bureau stations recorded, on an average, 110% of the normal sunshine.

Periods of wet weather were quite evenly spaced. The rains were mostly due to frontal passages, but the effects of a Florida hurricane were felt around the 9th, the chief source of moisture being the Atlantic Ocean. The passage of a rather slow-moving cold front lifted air which had previously been heavily saturated, and by the 12th, heavy rain was in evidence. The Gulf of Mexico provided the moisture source in the storm of the 18-19th; a widespread and typical low pressure system, with well-developed cold and warm fronts, moved rapidly northeastward from Oklahoma to Illinois in 24 hours, then to New England and out to sea in the following 24 hours, bringing considerable rain to Pennsylvania on those dates. The storm of the 26th and the following days was of the cold front type, the front moving rather slowly and being preceded by a squall line. Damaging winds were not, however, reported.

The little snow that occurred fell on the first. Measurable snow fell at only a few places. Heavy fog occurred practically every day somewhere in the State. Air traffic was hampered by widespread fogs around the 22d to 25th.

The absence of killing frosts over most of the State was favorable for late crops. However, the unseasonably warm weather at the end of the month was not good for newly seeded grains which attained rank growth.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 87 stations was 56.0°, which is 3.4° above the 59-year normal for October. The highest monthly mean was 63.2° at Marcus Hook, and the lowest was 50.0° at Kane. Extremes ranged from a maximum of 92° at Bethlehem on the 7th, to a minimum of 24° at Donegal, Philipsburg and Somerset on the 14th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 217 stations, was 3.50 inches, which is 0.23 inch above the 59-year normal for October. The greatest monthly amount was 5.50 inches at Sharpsville, while the least was 1.22 inches at Philadelphia City Office. The greatest amount recorded in any 24 consecutive hours was 2.51 inches at Erie on the 11-12th.

The average snowfall for the State was a trace, which is 0.2 inch below the 59-year normal. The greatest monthly snowfall was 0.3 inch at Springs. The greatest fall for any observational day was 0.3 inch at Springs on the 1st.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
a, b, c, etc. Number of days missing, for example, b indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

VOL. LI. NOVEMBER 1946. No. 11.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

The warm trend of the past two months continued throughout November, with about the same excess of temperature as in October. However, rainfall conditions were quite unlike those in October, rainfall during the latter month having been above normal, while November turned out to be dry. The combination of warmth and dryness was pleasant, at the same time being of large benefit to householders and industry in holding down fuel consumption during the recent strike-induced coal shortage.

Not since 1934 had it been so warm. Only six previous Novembers of record showed higher mean temperatures. The month began with about twelve days of unseasonably warm weather, followed by about a week of near normal temperatures, and ended in more warm weather. Some stations had above normal temperatures on almost every day, but no section of the State could be singled out as having a greater excess of temperature than another. Record or near record maxima occurred on some days at the beginning of the month.

In only five previous years of record was there less precipitation in November, and all but one station showed rainfall deficiency. For the State as a whole, precipitation was but 44% of the normal. This resulted in a deficiency of rainfall of 1.68 inches since January 1. Rainfall was extremely light in the southeast portion, increasing with latitude northwestward, and was greatest in the extreme northwest portion. The heaviest falls were due to extensive cold fronts which passed over the State at regular intervals and lifted warm and moist tropical maritime air, bringing rain, not only to Pennsylvania, but to large sections of the Northeast as well. Snowfall occurred on the 23d, with traces over most of the State, except in the northwest portion, where amounts of 0.5 inch to 1.5 inches fell in a few places. The normal snowfall for the month is 2.7 inches.

Heavy fog was most in evidence on the 21st, while high winds were general with the passage of a cold front on the 22d. Except for the northwest portion, sunshine was generally above normal.

This month ended one of the longest growing seasons in the memory of some of the oldest crop reporters. The growing season was extended considerably beyond expectations. September had been seasonal, and October warm with adequate rainfall. The November weather extended the harvest period of fall crops. The very fine weather during the latter month enabled growers to finish harvest without any loss of matured crops. There was some loss of root crops because of the high temperatures.

Altogether, the autumn was the warmest and driest since 1941. Only a trace of snow fell during September, October, and November. The year 1918 was the only one in which so little snow fell during those months.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 75 stations was 44.7°, which is 3.3° above the 59-year normal for November. The highest monthly mean was 53.0° at Marcus Hook, and the lowest was 38.2° at Newburg. Extremes ranged from a maximum of 83° at Uniontown on the 3d, to a minimum of 11° at Kane on the 15th.

ERRATA.—October, 1946, page 80, mean minimum temperature at Williamsport Airport should be 44.7°. Mean maximum and minimum temperatures at Williamstown should be §69.4° and §42.9°, respectively.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 212 stations, was 1.26 inches, which is 1.61 inches below the 59-year normal for November. The greatest monthly amount was 3.57 inches at Corry, while the least was 0.47 inch at Carlisle. The greatest amount recorded in any 24 consecutive hours was 1.25 inches at Corry on the 26th.

The average snowfall for the State was a trace, which is 2.7 inches below the 59-year normal. The greatest monthly snowfall was 1.5 inches at Bradford The greatest fall for any observational day was 1.5 inches at Bradford on the 23d.

OBITUARY

We regret to learn of the death on November 15, 1946, of Mr. [illegible] Jenckes, cooperative observer at Ansonia, Pennsylvania. His services began in October, 1908, and continued until the time of his death.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
a, b, c, etc. Number of days missing, for example, " indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

This was the fourth warm month in a row, and for the beginning of winter, was pleasant enough, having been also relatively dry and sunny over most of the State. Even in the northwest portion, where more normal conditions prevailed, there was some excess of temperature.

Real wintry weather was in evidence, however, during the first few days of the month. Maxima in the 50's on the first were quickly wiped out when an extensive cold front rapidly passed over the State, dropping temperatures as much as 40° and bringing in minima in some cases of record proportions on the 2d and 3d. Blustery winds accentuated the discomfort. Slush ice formed in the rivers at that time, while the west channel of the Susquehanna at Harrisburg was frozen over, a rare occurrence for so early in the season. But with the subsequent passage of the high pressure area back of the cold front, southerly winds brought up a spell of warm weather which persisted for more than a week. Some notable maxima were recorded during this period, principally on the 9th and 10th, when temperatures in the 60's were general and temperatures in the 70's no exception in the southeast portion. A cold front passage on the 14th brought temperatures down again for four or five days, but the minima were not unseasonable. The remainder of the month was warmer, and temperatures on the 28th were almost as spring-like as on the 9th and 10th.

The precipitation record varied about the State. In some parts of the northwest portion it was above normal, but on the whole it was but 75% of the normal. The number of days with precipitation also varied with locality, having been greatest in the northwest. Snowfall was 75% of the 57-year average, in decided contrast to conditions last year when 16.6 inches fell.

There were four main precipitation periods, centered mainly around the first, the 10th to 13th, the 20th-21st, and the 28th-29th. These were all associated with frontal systems. Rain on the 10th was responsible for putting out two forest fires at Lick Hollow in the vicinity of Uniontown. The storm of the 20th, which brought most of the snowfall of the month, was mainly a coastal low which developed a secondary depression and wave that spread northward from the south Atlantic coast. Sleet and freezing rain following the snow, made driving conditions particularly hazardous, but enough snow was left to assure a white Christmas for most of the State except the southeast portion. Driving was a dangerous undertaking around the 29th, owing to sleet and glaze. Thunderstorms occurred on the 29th west of the Allegheny Mountains.

Besides the windiness of the 2d, high winds occurred generally on the 12th and 13th, and during the last week of the month. Severe damage to the Pennsylvania State Park Peninsula was reported, the latter having been cut in two by huge waves from Lake Erie on the 12th and 13th.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 86 stations was 33.5°, which is 2.3° above the 59-year normal for December. The highest monthly mean was 40.4° at Marcus Hook, and the lowest was 26.7° at Eagles Mere.. Extremes ranged from a maximum of 75° at Lewistown on the 9th, to a minimum of −4° at Coudersport on the 3d.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 213 stations, was 2.32 inches, which is 0.76 inch below the 59-year normal for December. The greatest monthly amount was 4.75 inches at Bradford, while the least was 1.16 inches at Orwell. The greatest amount recorded in any 24 consecutive hours was 2.15 inches at Philadelphia City Office on the 20-21st.

The average snowfall for the State was 6.0 inches, which is 2.0 inches below the 59-year normal. The greatest monthly snowfall was 22.3 inches at Bradford The greatest fall for any observational day was 9.5 inches at State College on the 20th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).

[a],[*b],[c], etc. Number of days missing, for example, [b] indicates two days missing.

Italics, data interpolated.

§ Partly interpolated.

§§ Incomplete.

† And other dates.

†† Daily amounts inconsistent.

‡ Received too late to be included in means and summaries.

* Included in next measurement.

// Windshield on gage.

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

This year was pleasant from almost every standpoint. It was warm in the winter and cool in the summer. March was practically as warm as April, and September was almost as summery as August. June, July and August averaged the coolest since 1927. Precipitation was subnormal, but sufficient for growing crops, only May, June and October having shown excesses of rainfall. January and April were the driest of record. Sunshine and warmth made the growing season, which continued into November, the longest within the memory of some of the oldest crop observers. Snowfall was but half of the normal, in decided contrast to the previous year. There was but a trace of snow in September, October and November, a record equalled only in 1918.

Not all months offered ideal weather, however. February was quite wintry, while May, a very wet month, recorded record-breaking floods in north-central counties.

WEATHER BY MONTHS

JANUARY: A record month, this was the driest January in the 59 years of record. It was a little warmer than the normal. Snowfall was less than half of the normal, and only 22% of the previous January. Swollen rivers were produced early in the month by thawing of snow, augumented by some rainfall, but no flooding occured.

FEBRUARY: This was a typical Pennsylvania winter month, with temperature, precipitation and snowfall close to average. High winds occurred on St. Valentine's Day, which offered in addition, a variety of other weather, including a drop in temperature from near 60 to near zero readings in 24 hours, as well as heavy showers changing to snow. Heavy snowfall occured on the 19th, with falls of up to 18 inches in the mountain areas, followed by two days of windy weather, drifting the snow and blocking roads.

MARCH: Only March 1921 and 1945 were warmer, and then but slightly. Stations in the extreme west portion reported the highest means of record. Snowfall was the least since 1903, and was the second lowest amount of record. Fruit trees were advanced about four weeks.

APRIL: The proverbial "April showers" were not very heavy this year. Precipitation averaging only 35% of the normal made this the driest April of record. The total was 75% of the previous low established in 1900. Drought conditions developed in the southeast. Frost was a constant threat, owing to the advanced stage of vegetation so early in the season. There was serious damage in commercial fruit areas on the 11th and 28th. Dry conditions increased the number of forest fires, but constant vigilance kept losses low.

MAY: The "April showers" came a month late, this having been the wettest month since August 1933 and the second wettest May of record, exceeded only by that of 1894. Rain was general throughout the month to the 22d, but excessive rainfall of the 27th produced the most serious flooding of record in portions of Lycoming, Tioga and Bradford Counties. Flood stages were exceeded generally on the Susquehanna and at scattered points on the Ohio and Delaware Rivers, but to a lesser extent than in the north-central counties, where, as the waters receded, 12 deaths and millions of dollars damage were reported. These figures are much less than in the March 1936 flood, principally because of smaller areal coverage and greatly improved warning systems.

JUNE: This was another wet month, the wettest June since 1928 and the fourth wettest of record. Again there were floods and threats of flood, with serious damage reported in the Philadelphia area, northern Cambria County and southwestern counties. Eight deaths and property damage of more than a million dollars were attributed to weather causes, including, besides flooding, wind and lightning, and a rock slide near Viaduct in Clearfield County that resulted in a railroad wreck.

JULY: Those who were forced to stay home during the summer enjoyed pleasanter weather than usual. July was relatively cool and, despite the frequency of thunderstorms, which averaged one every other day, it was drier than usual. Very little hail was observed during the thunderstorms, but four deaths from lightning occurred at scattered places. An all-time 24-hour rainfall record was set at Wilkes-Barre on the 31st, when 7.62 inches was measured in 24 hours. The bulk of the rain occurred in less than eight hours and resulted in flooding of cellars and streets. Some complained that damage was heavier than in a major flood.

AUGUST: Continuing the cool trend of the past four months, this was the second coolest August of record. Rainfall was but slightly deficient for the State as a whole, but it was a dry month for the western counties. There were frequent thunderstorms, however, being most general on the 26th, when damaging hail occurred at several places. Depths of hail ranged to over three inches near Doylestown and in the vicinity of Harrisburg. Crops and gardens were damaged, some a total loss. A tornado struck a rural community in the vicinity of Lime Valley, 11 miles south of Lancaster, on the 19th, and caused some damage to property and crops, but no casualties.

SEPTEMBER: This was a warm and pleasant month, less than three degrees cooler than August. There were only 7 days with rain, but thunderstorms were general on the 10th and 29th. Wind did extensive damage at Lock Haven on the 10th, having injured two persons and destroyed considerable property, including several airplanes, buildings and power lines. Wind and hail wrought damage on the 29th in Beaver County.

OCTOBER: With temparatures, sunshine and rainfall above normal, this was a good growing month. Pastures greened almost as in spring, saving farmers the cost of fodder. This was the 6th warmest October of record. Unseasonably warm weather of record proportions came at the end of the month.

NOVEMBER: The warm trend of the past two months continued throughout the month, but unlike October, November was dry, with but 44% of the normal precipitation. This was the 7th warmest and 6th driest November of record. Only a trace of snow fell during the month.

DECEMBER: For the beginning of winter, this was a quite pleasant month, having been relatively dry, sunny and warm. Real wintry weather was in evidence the first few days, with quite low temperatures and blustery winds. The rest of the month was generally confortable, with several warm spells in which notable maxima were recorded, when temperatures in the 60's were general. The State had a white Christmas, except in the southeast portion.

VOL. LII. JANUARY 1947. No. 1.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

The year 1947 got off to a warm start, January having continued the warm trend of the past four months, with an even greater excess of temperature than in any of the previous months.

This was the warmest January in ten years and was the sixth warmest of record. The first ten days were generally somewhat colder than the normal, except for a few days, but from then on, there was considerable warming, except around the 21st and 22d. Some days were more than 20° above normal. Notable maxima were recorded in the last week, with temperatures in the 60's general, reaching 70° or above at some stations. Record maxima were recorded at Harrisburg on the 25th, 29th, and 30th; at Philadelphia on the 20th, 25th, and 30th; and at Pittsburgh on the 30th. An exception to the warm weather of the last half of the month occurred on the 22d, when the lowest temperatures for the month were recorded at most stations.

Precipitation for the month totaled 17% above normal, and total amounts did not vary considerably throughout the State. Periods of storminess were at rather evenly spaced intervals of about four days. Precipitation was mostly in the form of rain instead of snow, a reflection of the high prevailing temperatures. Snowfall was about two-thirds of the normal, but varied about the State, having been least in the southeast portion and highest in the northern Alleghenies, as would be expected. Wave disturbances connected with coastal depressions caused the rainfall conditions of the first week. New Year's Day was particularly unpleasant, with sleet, glaze, snow, and generally hazardous driving, resulting in numerous accidents. Glaze and sleet were also apparent on the 7th. A deep low pressure area with an extensive occlusion was responsible for the rain of the 15th. The week of the Pennsylvania Farm Show, from the 13th to the 17th at Harrisburg, brought "regular Farm Show weather" in the early part, with sleet and freezing rain. Thunderstorms occurred about this time at some stations. A low developing over the southeastern states moved northward to Ontario by the 20th, and deepened considerably to provide the rain and windiness on the 20th and 21st. Frontal passages were responsible for the rainfall of the 26th and 30th. Thunderstorms occurred at scattered places on the 30th.

Windiness was general about the 7th and 8th, and again on the 20th, 21st, and 22d, following frontal passages. The 34th Governor of Pennsylvania was inaugurated at Harrisburg under clear skies, but with blustery and cold winds. Happy in the thought that rain or snow did not hamper the outdoor exercises, the Governor and his officials proceeded with the ceremonies, unmindful of the chill. But the occasion was far from the festive one it would have been, had the weather been finer. Toy balloon hawkers complained of poor business, as there were few children afoot.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 83 stations was 33.6°, which is 5.3° above the 60-year normal for January. The highest monthly mean was 39.9° at Marcus Hook, and the lowest was 27.2° at Montrose. Extremes ranged from a maximum of 72° at Carlisle and York on the 30th, to a minimum of −6° at Johnstown on the 22d.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 211 stations, was 3.65 inches, which is 0.52 inch above the 60-year normal for January. The greatest monthly amount was 6.42 inches at Marienville, while the least was 1.69 inches at Towanda. The greatest amount recorded in any 24 consecutive hours was 1.87 inches at Glen Hazel on the 19-20th.

The average snowfall for the State was 7.2 inches, which is 3.3 inches below the 60-year normal. The greatest monthly snowfall was 20.4 inches at Kane. The greatest fall for any observational day was 6.8 inches at Park Place on the 5th and 6th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
a, b, c, etc. Number of days missing, for example, " indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
| And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
• Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.

VOL. LII. FEBRUARY 1947. No. 2.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Winter finally arrived after months of pleasant weather. This was the coldest February in eleven years, the tenth coldest in 60 years, and the most unpleasant month since January 1945. Among the hardships was the excessive snowfall, this having been the snowiest February since 1926 and the seventh snowiest of record. This was all the more unusual, since the precipitation totaled exactly half of normal, and it was the driest February in six years and the fifth driest of record. The explanation of this seeming paradox is that all the precipitation was in the form of snow, generally of a light and fluffy kind, having low moisture content.

The western counties had the greatest number of days with precipitation, and the snowfall averaged more than twice the normal in that area. However, the heaviest storm occurred on the 20th and 21st in the southeastern and central counties. In the latter sections this one snowstorm accounted for practically all of the monthly amounts. The State averaged 86% above normal snowfall. The monthly total was the greatest at Pittsburgh for February since 1914, and the highest amount at Philadelphia since January 1935.

There were two main periods of storminess. In the first week an extensive cold front passage resulted in general precipitation throughout the State, and was followed by another storm that affected the northwest sections. The snowfall of the 20th was the result of an intense storm that came up from the Gulf of Mexico and went out to sea at our latitudes. The low temperatures drawn into the low pressure system were the deciding factor in producing snow instead of rain, and although the center was 150 miles off the coast of Maryland on the morning of the 21st, the storm was so extensive that heavy snow was measured in all parts of Pennsylvania. In the southeastern and central counties, the depths totaled the greatest since 1936.

Naturally, such excessive snowfall caused hardship. Twenty-one people died as a result of the storm of the 20th, eighteen at Philadelphia alone. Most of these deaths were due to heart attacks brought about while battling heavy snow. Much could be written about the severity of the snowstorm, the drifts, traffic tie ups, lack of protection against fire hazards, motor accidents, loss of business, closing of schools, sickness, the temporary but total disappearance of air transportation, and other concomitants of an excessive snowfall. At least two days elapsed before traffic conditions were restored to normal, but drifting was still in evidence at the end of the month.

Temperatures were rather severe in the first week, with below zero reported at many stations. The middle of the month was above normal, but fell below normal again about the 19th and remained so until the end of the month.

An unusual feature was the fact that sunshine averaged above normal at all official Weather Bureau stations except Erie, which has had excessive cloudiness of late.

For the winter season of December, January and February, there was a temperature excess of one degree, in spite of the cold of February, while precipitation was only 82% of normal seasonal.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 83 stations was 23.2°, which is 5.1° below the 60-year normal for February. The highest monthly mean was 31.2° at Marcus Hook, and the lowest was 16.4° at Kane. Extremes ranged from a maximum of 58° at Newburg and Lewistown on the 15th and 16th respectively to a minimum of −13° at Kane and Lawrenceville on the 5th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 207 stations, was 1.39 inches, which is 1.39 inches below the 60-year normal for February. The greatest monthly amount was 6.01 inches at Kregar, while the least was 0.34 inch at Millersburg. The greatest amount recorded in any 24 consecutive hours was 2.05 inches at South Mountain on the 20th.

The average snowfall for the State was 19.5 inches, which is 8.7 inches above the 60-year normal. The greatest monthly snowfall was 61.3 inches at Kregar. The greatest fall for any observational day was 18.8 inches at Ephrata on the 20th-21st.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.

VOL. LII. MARCH 1947. No. 3.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM: (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

March this year came in like a lion and continued to act accordingly except for a few lamb-like days in the middle of the month and the very last day. It was, in all, unpleasant, quite unlike the warm March weather of 1945 and 1946. This was the coldest and driest March since 1941 and was the coldest month of the season. The wind was, however, the greatest culprit among the meteorological elements in making the month unpleasant.

Precipitation was only 65% of normal, making this the 7th driest March of record. Owing to the cold, however, snowfall was 62% above normal, and in northwestern counties was as much as three times normal. There were three general storms, spaced rather evenly apart. The storm of the 1st to 3d was due to overrunning in advance of a warm front and resulted in the heaviest snowfall, followed by high winds after the passage of a cold front, causing drifting and the resulting blocking of roads. Around the 13th, some of the heaviest rains occurred, connected with a complicated frontal and isobaric system in which the moisture source was the Gulf of Mexico. But the most violent storm was that of the 23d to 26th. This was an intense depression, with accompanying fronts, which moved northeastward across the State. It had a large variety of associated phenomena, including thunderstorms, a drop in temperature of the order of 30 degrees in 24 hours, and high winds. This was probably the most widespread and violent storm of recent years.

Wind damage was reported from every part of the State on the 25th, velocities of 60 and 70 miles per hour not being unusual. Reports of unroofed buildings and other damage to property were so numerous that space cannot be given to list more than a few. On March 24th, at Curwensville, during a thunderstorm, a transformer of a power line was struck by lightning. At Philipsburg, electric and telephone wires were snapped during a thunderstorm and high wind. At Indiana, electric power was off for two and a half hours due to the same reason. On March 25th, Pittsburgh and vicinity suffered millions of dollars damage due to high winds up to 90 miles per hour, which unroofed many buildings and shattered plate glass windows. At Harrisburg, two persons were injured, one critically, when struck by tile ripped off a building by the wind. Many windows were smashed, buildings unroofed, and chimneys blown over. Telephone poles were ripped off, trees felled, and power lines knocked out by gusts up to 60 miles per hour. In Philadelphia, a two year old girl was critically injured when thrown to the pavement by the wind. At Vandergrift, one man was killed by a high tension wire when he tried to remove a tree which was blown across his automobile.

Temperatures were below normal on all but six days. Nighttime temperatures were nearer normal, but the mean equaled that of March 1941 and 1892 as the 6th coldest of record. An unusual feature was the absence of any temperatures as high as 70°. Sunshine was above normal in the eastern counties and generally below normal in the western part, especially in the northwest of the State.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 85 stations was 31.8°, which is 5.9° below the 60-year normal for March. The highest monthly mean was 40.6° at Marcus Hook, and the lowest was 25.0° at Kane. Extremes ranged from a maximum of 67° at York on the 14th, to a minimum of −8° at Kane on the 1st.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 208 stations, was 2.27 inches, which is 1.23 inches below the 60-year normal for March. The greatest monthly amount was 4.93 inches at Mount Pocono, while the least was 1.07 inches at Midland. The greatest amount recorded in any 24 consecutive hours was 2.41 inches at Portland on the 13-14th.

The average snowfall for the State was 12.6 inches, which is 4.8 inches above the 60-year normal. The greatest monthly snowfall was 56.0 inches at Corry. The greatest fall for any observational day was 25.0 inches at Pleasant Mount on the 2-3d.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T, Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
° Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.

REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

After two months of unpleasant weather, April was a welcome relief. Relatively high daytime temperatures brought the month above normal, although the nights were cool. There was considerable windiness, but this generally occurred on warm days. Precipitation was above normal, and at several widely scattered stations was as much as twice the normal.

In general there were about as many days with temperature excess as with deficiency, and both warm and cool spells lasted only a few days. There were several days on which maximum temperatures in the 70's and 80's were recorded, and Easter Sunday (April 6) was one of them.

Precipitation was frequent and copious. The heaviest rains in many places came on April 5, which resulted in flooding at Towanda and Wilkes-Barre, and in some low portions of the city of Wellsboro, the Lackawanna Valley cities and towns, and several smaller communities. Total damage was estimated initially at about a million dollars. Thirty-four bridges were wrecked in the State, with replacement value estimated at $150,000. At Meadville one life was lost, that of 14-year old Richard Ross, who rode his bicycle into the swirling waters and drowned in about five feet of water. Thousands of people had to spend their Easter away from their homes, as they were evacuated to avoid flood dangers. There was some heavy rain toward the end of the month, but luckily, without flooding.

Windiness was very much in evidence throughout the month, and the highest velocities occurred on Easter in most places. At Pittsburgh on that day, extensive damage was done to utility poles, trees, porches, roofs and windows by winds reaching 80 m. p. h., while at Wilkes-Barre, four airplanes were slightly damaged by winds reaching 60 m. p. h.

Electrical phenomena of a peculiar nature occurred in Buchanan Valley, near Cashtown, in Adams County over a radius of about a mile and a half, on April 2, causing damage of several hundred dollars to four buildings, setting fire to one of them and putting power and telephone lines out of service. There were at least two lightning bolts as the storm swept through the valley, accompanied by a brief but torrential rain. Some people believe that there was a deluge of lightning bolts, while others thought that there was a meteor shower. Between 10:15 P. M. and 10:30 P. M., as reported by several residents, the earth was lit up as if by the sun and balls of fire floated about inside and outside of houses. An oak tree more than a foot in diameter and a nearby ash tree of the same size were shattered and splintery fragments covered the ground for a radius of 75 yards. The tree trunks looked as if they had been dynamited. Great holes were torn in the rocky mountainside, resembling shellholes. Furrows were plowed in the earth. A four-strand wire fence disappeared, completely burned away except for a few wire fragments with fused, melted ends. The staples and the posts that had supported the fence looked untouched. Mr. W. E. Cole reported that at 10:15 P. M., there was a sound like a pistol shot, and the lights went out. Mr. Cole then saw a red ball of fire more than a foot in diameter. He rushed to the cellar to turn off the electricity. As his hand left the fuse box he heard another shot-like sound, and more glowing balls of fire appeared about him. Mrs. J. B. Kaiser reported similar experiences. The next morning she found the ground around the house covered with charred shreds of trees. Near the trees the ground was almost white with fragments no larger than toothpicks. Mr. Frank Dillon reported that the fireballs seemed to roll right through their house. Mr. and Mrs. Fred Boyer saw the fireballs outside their house. The home of Mr. Paul McKendrick was set ablaze when their radio went up in flames. Some people said they thought it looked like the end of the world.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 49.1°, which is 0.5° above the 60-year normal for April. The highest monthly mean was 56.0° at Donora, and the lowest was 41.8° at Eagles Mere. Extremes ranged from a maximum of 85° at Lancaster on the 5th, to a minimum of 11° at Emporium and Ridgway on the 1st.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 213 stations, was 3.86 inches, which is 0.44 inch above the 60-year normal for April. The greatest monthly amount was 8.88 inches at Erie, while the least was 1.38 inches at Hyndman. The greatest amount recorded in any 24 consecutive hours was 4.06 inches at Philadelphia City Office on the 30th-1st.

The average snowfall for the State was 0.1 inch, which is 2.0 inches below the 60-year normal. The greatest monthly snowfall was 6.5 inches at Bradford. The greatest fall for any observational day was 4.0 inches at Bradford on the 1st-2d and Tamarack on the 25-26th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T. , Trace (0.005 inch or less).
a, b, c, etc. Number of days missing, for example, b indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

GENERAL SUMMARY.

The fourth wettest May of record transformed the rainfall deficiency that had accumulated in the first four months of this year into an excess. The lowest temperature ever recorded for May occurred during a cold spell from the 7th to 10th inclusive. An area of less than 25 miles diameter in Schuylkill and Berks Counties suffered visitations of tornadoes on three days spaced four days apart. The nearest approach to such a frequency occurred in June 1917, when three tornado days were also observed.

A series of rapidly moving depressions, with associated fronts, resulted in measurable rain on eighteen days, a record equaled only in 1933 and 1943. Some snow occurred generally during the early cold spell, but with the exception of Meadville, where 3.4 inches fell in 24 hours on the 7th and 8th, amounts were of the order of a trace. On the 13th, rain extinguished a forest fire that had raged for two days near Milroy. Lightning set off some costly fires, notably on the 19th near Harrisburg, where $17,000 worth of farm equipment and livestock was lost in a series of fires, and on the 25th at Peach Glen, where a loss of $200,000 was sustained in the destruction of a factory by fire set off by lightning.

Although there was a temperature deficiency of two degrees, which is not unusual, it helped make this the coolest spring in seven years. Vegetation was delayed considerably and had been considered free of frost danger, when the cold spell of the 7th and following days struck, with temperatures sometimes too low to be raised much by smudgepots. A new low temperature record for the State was reported on the 8th at Donegal, Kane, and Somerset, the 16° at those stations breaking the previous minimum of 18°. Damage was done to cherry, apple, and peach trees. An ingenious farmer near Waynesboro used a helicopter on May 10 to stir up the surface air over his orchard and upset the inversion. This was a successful experiment, the temperature of the orchard being brought up in a few minutes from 26° to above 32°.

On the 21st a tornado struck at Shoemakersville, at 4:45 p. m., along a path about half a mile wide and six miles long, from Centerport to east of Mohrsville. It killed a thirteen year old boy, when the garage in which he and his brother had taken shelter was destroyed. His brother was carried 50 feet, but was unhurt. The building was carried 100 feet. On the 25th, a small tornado, accompanied by heavy rains and lightning, struck in the vicinity of Hamburg and Lenhartsville at 5 p. m. It damaged a Sunday school house, ripping off the roof and scattering parts of it for 500 feet. Other houses were unroofed, and trees and electric service poles blown down. On the 29th, a tornado at Pine Grove resulted in the death of a farmer and two horses, as it demolished a barn. The tornado damaged a number of other houses and trees in a path at least 1½ miles long. At Carlisle, North Middletown and Middlesex Townships, about 3:30 p. m., a tornado damaged scores of buildings on the same day along a fifteen mile path in which the intensity varied frequently. At Harrisburg, on the 29th, a gust of wind estimated at 55 miles per hour uprooted numerous trees and tore roofs off several houses and barns. These violent storms were associated with a cold frontal passage that caused an unseasonably cool, but pleasant, Memorial Day.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 57.7°, which is 2.0° below the 60-year normal for May. The highest monthly mean was 64.2° at Phoenixville, and the lowest was 51.3° at Kane. Extremes ranged from a maximum of 93° at Phoenixville on the 14th and 21st to a minimum of 16° at Donegal, Kane, and Somerset on the 10th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 214 stations, was 6.36 inches, which is 2.35 inches above the 60-year normal for May. The greatest monthly amount was 11.84 inches at Freeland, while the least was 2.16 inches at Dunlo. The greatest amount recorded in any 24 consecutive hours was 3.31 inches at Virginville on the 25th.

The average snowfall for the State was 0.2 inch, which is 0.2 inch above the 60-year normal. The greatest monthly snowfall was 4.5 inches at Kane. The greatest fall for any observational day was 3.4 inches at Meadville on the 7-8th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
• Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

HARRISBURG, PA.

VOL. LII. JUNE 1947. No. 6.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Despite some uncomfortably warm days, this was a cool month. It was like June of last year in that respect, and the records would have to be turned back to 1928 for a lower June temperature. Unlike last year, rainfall was near normal, in spite of which this was the driest in four years. Wind was responsible for some of the more spectacular manifestations of weather, particularly in Mercer County, where a tornado wrought considerable havoc.

There were no frost occurrences, but a few places reported temperatures of 32° or below. Warm spells were rare, one coming around the 9th to 11th, and another at the end of the month. The last half was generally cool and rather dry.

Rain fell during five main periods of storminess. On the 3d, a depression which moved from Ohio into Pennsylvania, with an extensive front preceded by a squall line, caused general rains which were heaviest in the north portion. On the 7th and 8th, a low pressure area with several associated fronts brought heavy showers, thunderstorms, a tornado, and some non-tornadic high winds. The showers of the 14th were brought on by a slow-moving depression of moderate intensity with wave action along a warm front, followed by a squall line and then a cold front. The rains of the 28th were due to a solitary squall line passage.

The tornado on the 8th was of great intensity. It originated northeast of Akron, Ohio, entered Pennsylvania near Sharon, and caused three deaths and more than a million dollars of property damage in its passage across Mercer County. The towns of Sharon, Mercer, and Grove City were chiefly affected. The greatest toll was in Sharon, where, in addition to the three fatalities, more than 300 persons were injured, 51 of them requiring hospitalization. According to the Mayor of Sharon, 25 houses were destroyed and 300 others damaged. In a 15 block area containing at least a hundred houses, all were damaged. Two of the deaths occurred when a large garage was destroyed, the heavy roof crushing the men within. The death toll was considered remarkably low in view of the extensive damage. The tornado struck Sharon at 2:30 P.M., E.S.T., and plowed through a path up to four miles wide. Mercer was struck at 2:55 P.M., and Grove city somewhat later. Property damage in the latter two places was heavy, but only a few people were injured. The usual tornado stories cropped up. At a large lumber yard, thousands of board feet were scattered about like matchsticks. A case of Coca-Cola floated in the air. The sky blackened as if it were night. Hail fell, some stones reported as long as two inches, and there was heavy rain.

At Dillsburg, near Harrisburg, a large barn was demolished by wind on the same day. On the 11th, heavy hail fell in and around Harrisburg. Stones an inch in diameter were common, and some as large as eggs were reported. The city escaped severe damage from hail, but some trees were torn up by the high winds and some streets flooded. Lightning also caused damage to electrical equipment.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 85 stations was 66.0°, which is 2.1° below the 60-year normal for June. The highest monthly mean was 72.2° at Marcus Hook, and the lowest was 59.7° at Kane. Extremes ranged from a maximum of 98° at Burnt Cabins and Lewistown, on the 11th, to a minimum of 29° at Phillipsburg on the 4th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 214 stations, was 4.04 inches, which is 0.12 inch below the 60-year normal for June. The greatest monthly amount was 6.88 inches at Mercersburg, while the least was 1.86 inches at Scranton. The greatest amount recorded in any 24 consecutive hours was 3.23 inches at Donegal, on the 7th.

OBITUARY

We regret to learn of the death on June 23, 1947, of Mr. Jacob B. Lambert, cooperative observer at Stroudsburg, Pennsylvania. His services began in July, 1942, and continued until the time of his death.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T, Trace (0.005 inch or less).

[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.

Italics, data interpolated.

§ Partly interpolated.

§§ Incomplete.

† And other dates.

†† Daily amounts inconsistent.

‡ Received too late to be included in means and summaries.

* Included in next measurement.

// Windshield on gage.

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

L. F. CONOVER

HARRISBURG, PA.

VOL. LII. JULY 1947. No. 7.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

This was the coolest July in 53 years, except for the year 1920, when this month's mean temperature was equaled. It was also the wettest July in 51 years. Some of the rainfalls were exceptionally heavy, and although there were no floods on the main rivers, caused considerable distress and much property damage through local flooding. Cloudiness was above normal, with the number of cloudy days being nearly double the normal. Warm spells of brief duration occurred about the 1st and 30th, when temperatures of 90° and above were general. A cool period with temperatures in the 40's occurred about the 24th.

Measurable rainfall occurred on 16 days, the greatest number of record. The average is 11 days. Thunderstorms were also frequent; a thunderstorm occurred somewhere in the State on all but four days. There were two main periods of heavy precipitation, the 7th and 16th. The former was the result of frontal action, while the latter occurred in convergence induced in a low pressure area. The heaviest recorded rainfall, however, was on the 22d and 23d at Erie. On that day the air moving southward over Lake Erie was unstable and of high moisture content, and it is believed that the 10° warmer lake and the upslope of the south shore were sufficient trigger action to start the convective process that caused the heavy rainfall. The official recorded maximum rainfall at the Weather Bureau station at Erie was as follows: 5 minutes, 0.63 inch; 10 minutes, 1.09 inches; 30 minutes, 2.02; 1 hour, 2.97; 3 hours, 6.32; 24 hours, 10.41. Unofficial measurements by Weather Bureau field investigators disclosed that at least 20 inches fell in parts of Erie. However, at Port Erie Airport, only 3.70 inches fell.

The heavy rainfall at Erie caused considerable flooding in low areas of the city, where 66 persons were evacuated by the Coast Guard and Red Cross, assisted by the Police and Fire Departments. There were no casualties and no serious injuries as a result of the rain. Engine rooms of many manufacturing plants were flooded and basements of houses and warehouses flooded generally in the downtown and eastern city areas. Damage was conservatively estimated at $250,000.

Lightning, wind and hail caused their fair share of trouble. At Hawley, on the 1st, a lightning storm caused damage to buildings and trees. At Corry, a gasoline station was struck by lightning on the 11th, while on the 14th, at Derry, some trees were ripped up and damage caused to gardens. Some hailstones the size of half dollars fell on the 14th in the vicinity of Scranton. At Franklin on the 16th a young man was killed by lightning while driving a tractor. On the 29th at Liverpool and vicinity, hail, wind, and rain caused extensive damage to crops and gardens, broke windows, uprooted trees and unroofed buildings. Hailstones of one inch diameter were reported.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 85 stations was 69.5°, which is 2.6° below the 60-year normal for July. The highest monthly mean was 77.8° at Marcus Hook, and the lowest was 63.2° at Springs. Extremes ranged from a maximum of 100° at Marcus Hook on the 30th, to a minimum of 38° at Kane and Phillipsburg on the 24th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 214 stations, was 6.23 inches, which is 1.92 inches above the 60-year normal for July. The greatest monthly amount was 19.81 inches at Park Place, while the least was 1.57 inches at Farrell. The greatest amount recorded in any 24 consecutive hours was 10.42 inches at Erie, on the 22d and 23d.
